6 Minute Walk Test
What is a 6 minute walk test?
A “6 minute walk” test is a simple procedure performed to give the doctor accurate information about your blood oxygen levels whilst you exercise.

Why do I need to have this test?
Your doctor has asked that you have this test to determine whether you need additional oxygen when you are exercising. In some situations, the 6 minute walk test provides better information of a patient’s ability to perform daily activities.

What happens during the test?
Before the test begins the Physiologist will explain the test to you in detail and will answer any questions that you have.

A probe will be put on your finger. This will provide us with information about your blood oxygen levels. You will then be asked to walk for 6 minutes.

The test will take approximately half an hour to complete. The length of the test may vary slightly depending on your oxygen levels during the test.

Important information
- Please continue to take all medications as normal.
- Please do not wear nail varnish to your appointment.
- Please bring any walking aids (stick etc) that you regularly use when walking and any oxygen prescribed to you for use whilst walking outside the home.

Thank you for your co-operation. This will assist us in obtaining accurate information and enable us to provide you with the most appropriate treatment.
Frequently asked questions

Will I experience any discomfort or side effects?
There are no known side effects associated with this test.

Is there a different test I could have?
There is no other test that would give us this information about your exercise tolerance and limitations.

When will I be told the results of my test?
You are usually told your results at your next clinic appointment, or a letter may be sent to your GP or the doctor who referred you for the test.

What should I wear when I attend for my test?
You should wear normal comfortable clothing and flat shoes suitable for walking in.
